

Download and install Bluestacks 5 - [https://https://www.bluestacks.com/download.html](https://www.bluestacks.com/download.html)

After installation, the initial image will open, close the program and use this shortcut (Multi-instance):

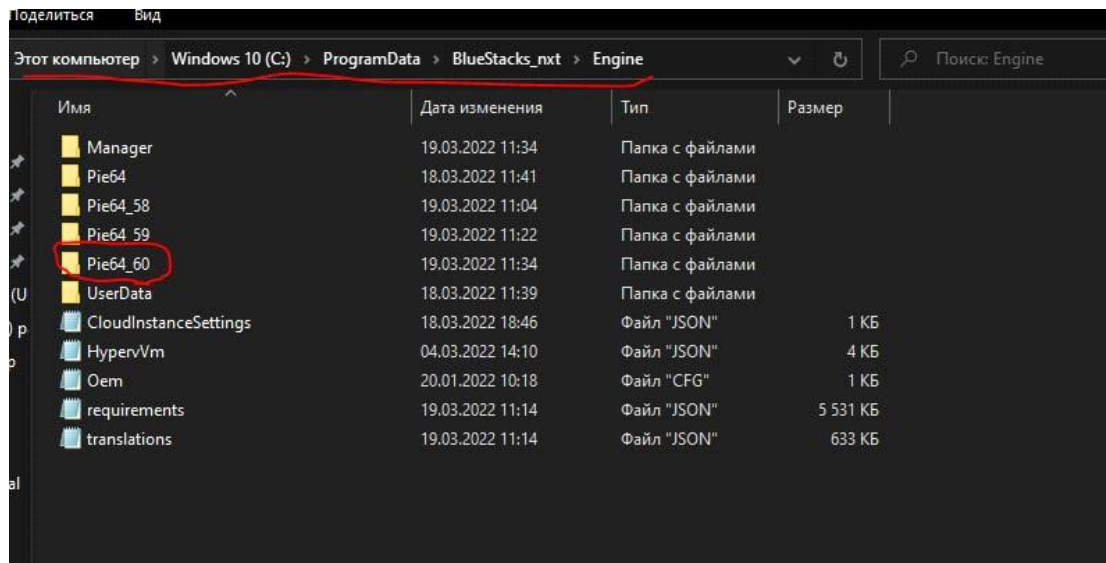

Set vertical view

We look at the number, for example, we have now created the 60th image.

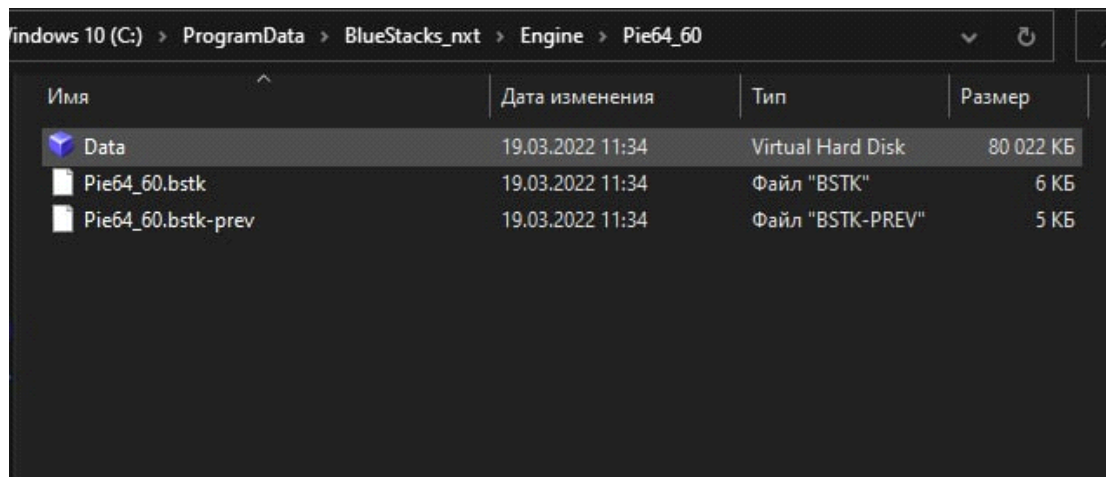

!!!!!!!!!!!!!!!!!!!!!! EXACTLY ProgramData (Hidden folder) AND NOT Program Files Go to the path - C:\ProgramData\BlueStacks_nxt\Engine

If the folder is not visible: This is a hidden folder by default in Windows, You go to My Computer - at the top "view" - put a checkmark on "hidden items".

Based on my example, go to the folder - Pie64_60

Here's what we see

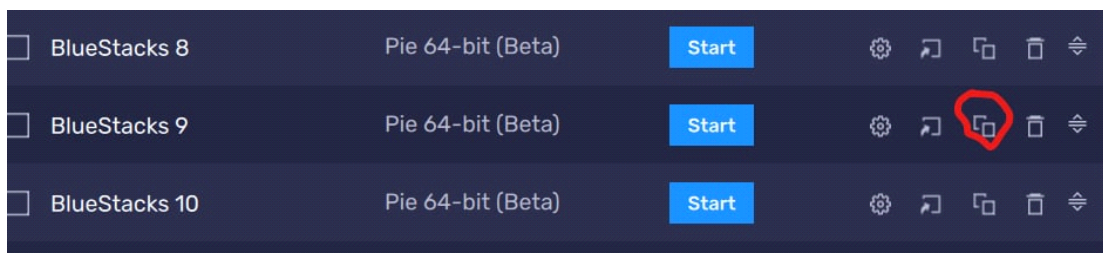

File Data.vhd Replaced on mine.

For convenience, now you can rename it as you like.

Turn on VPN on your computer or Proxy. Go into the emulator. Open the settings button at the top. Set the language to English. Check IP - whoer.net and use

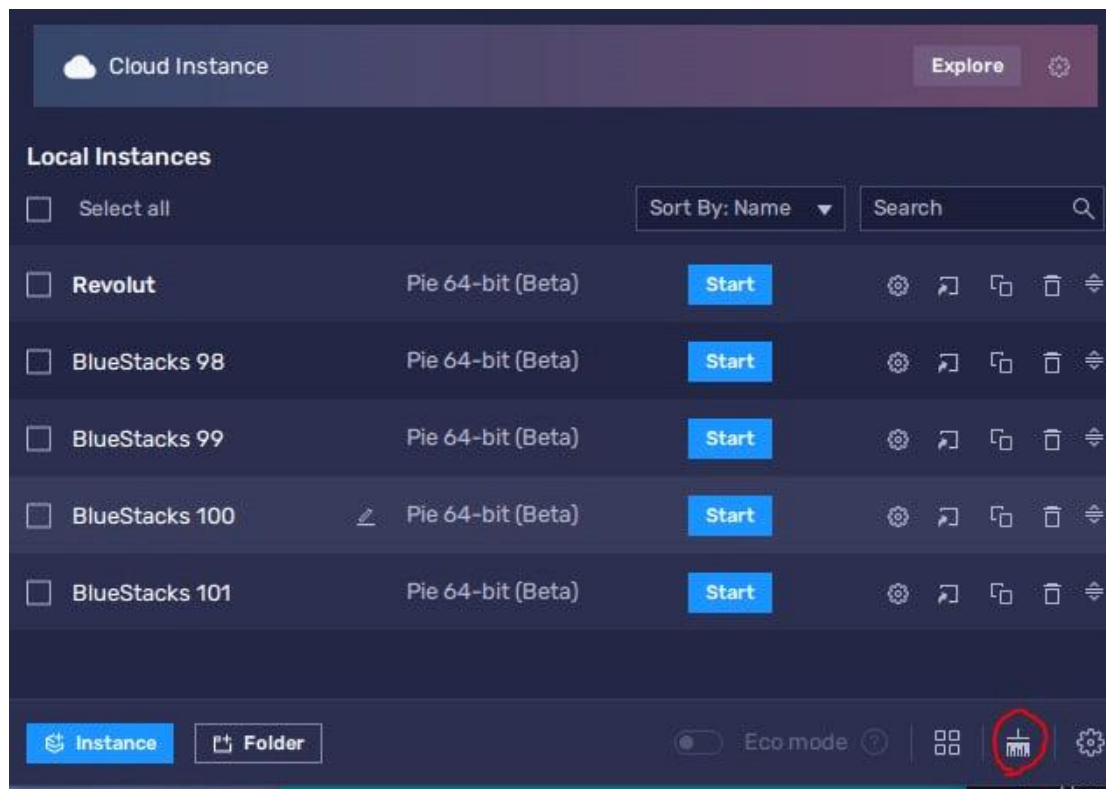

IMPORTANT ADDITION

After the first use, when you turn on the emulator, you will see an error. In order to fix this, just make a copy and run a new image (there will be no problems in the future)!

A profile with an error after the copy can be deleted.

IMPORTANT ADDITION

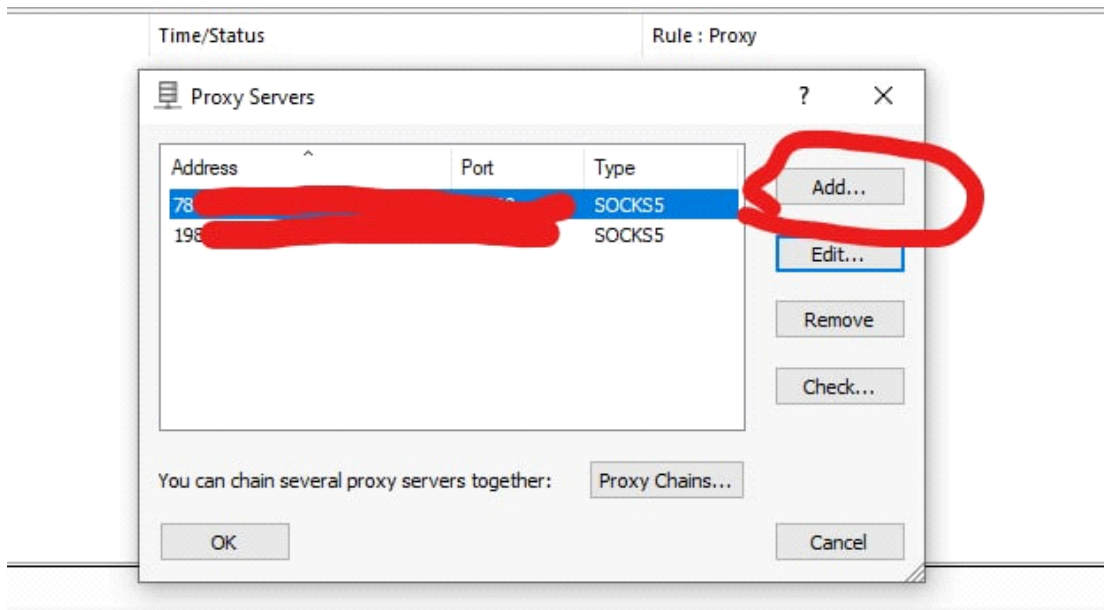

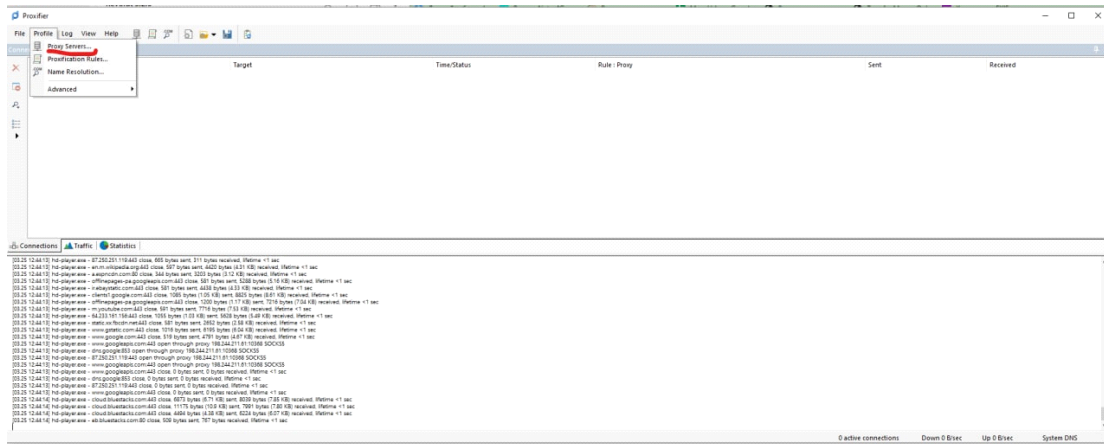

Logging in to Revolut keeps closing the app.

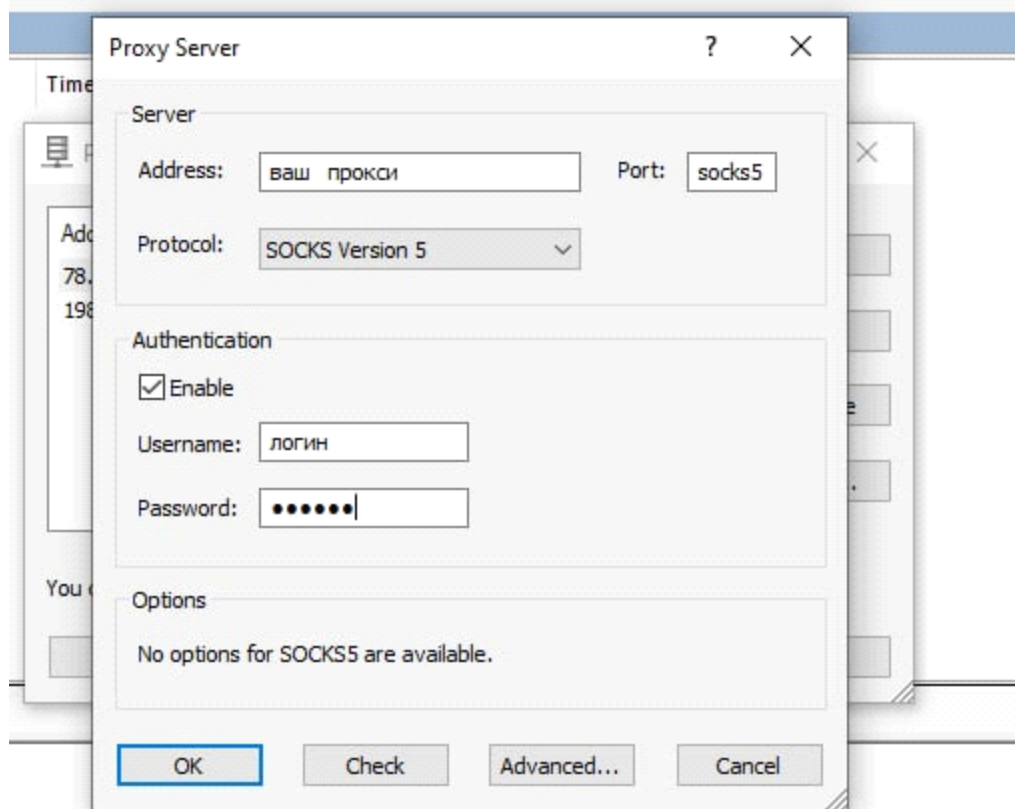

The solution to the problem is to clean up.

Proxy setting (Proxifier)

1) to configure vpn for the BlueStacks application (so that the vpn works only in this application and does not affect others), download the ProxiFier program (you can from the off site.)
<https://www.proxifier.com/download/>

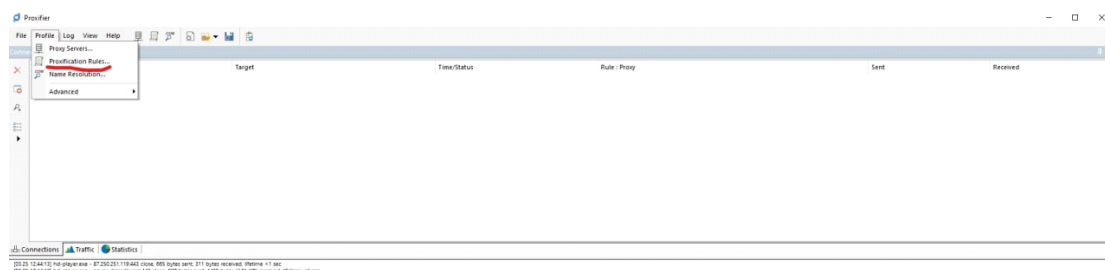

2) installed the program and put your proxy there.

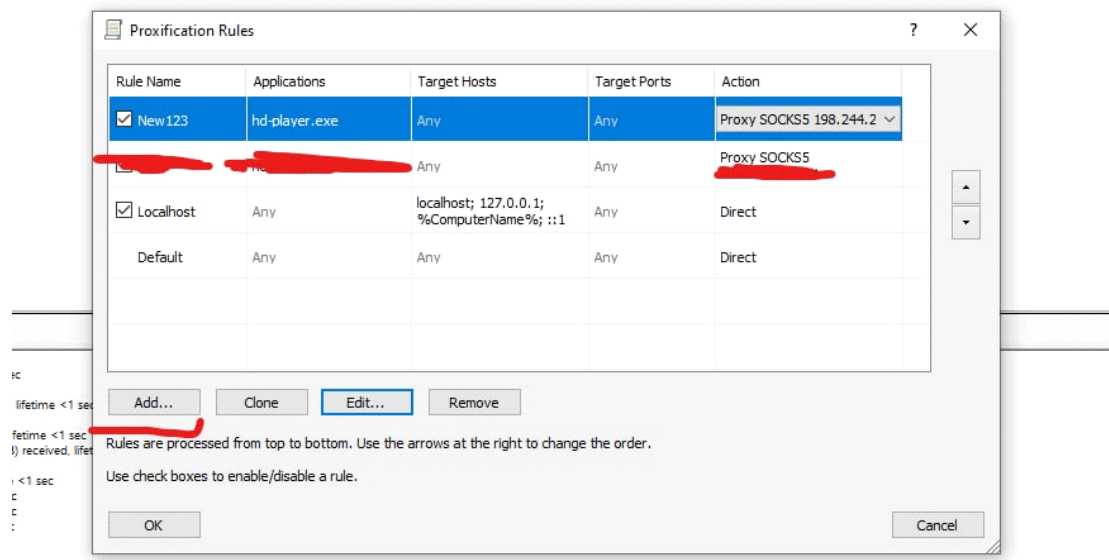

3) click OK, we see it in the list of your proxies.

4) open the profile, click on Rules

in the window that appears, click ADD

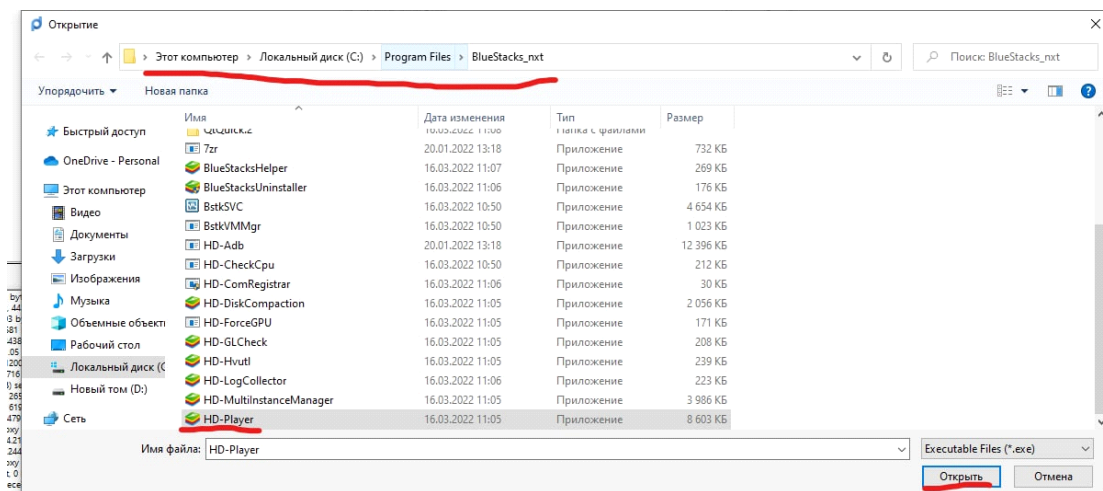

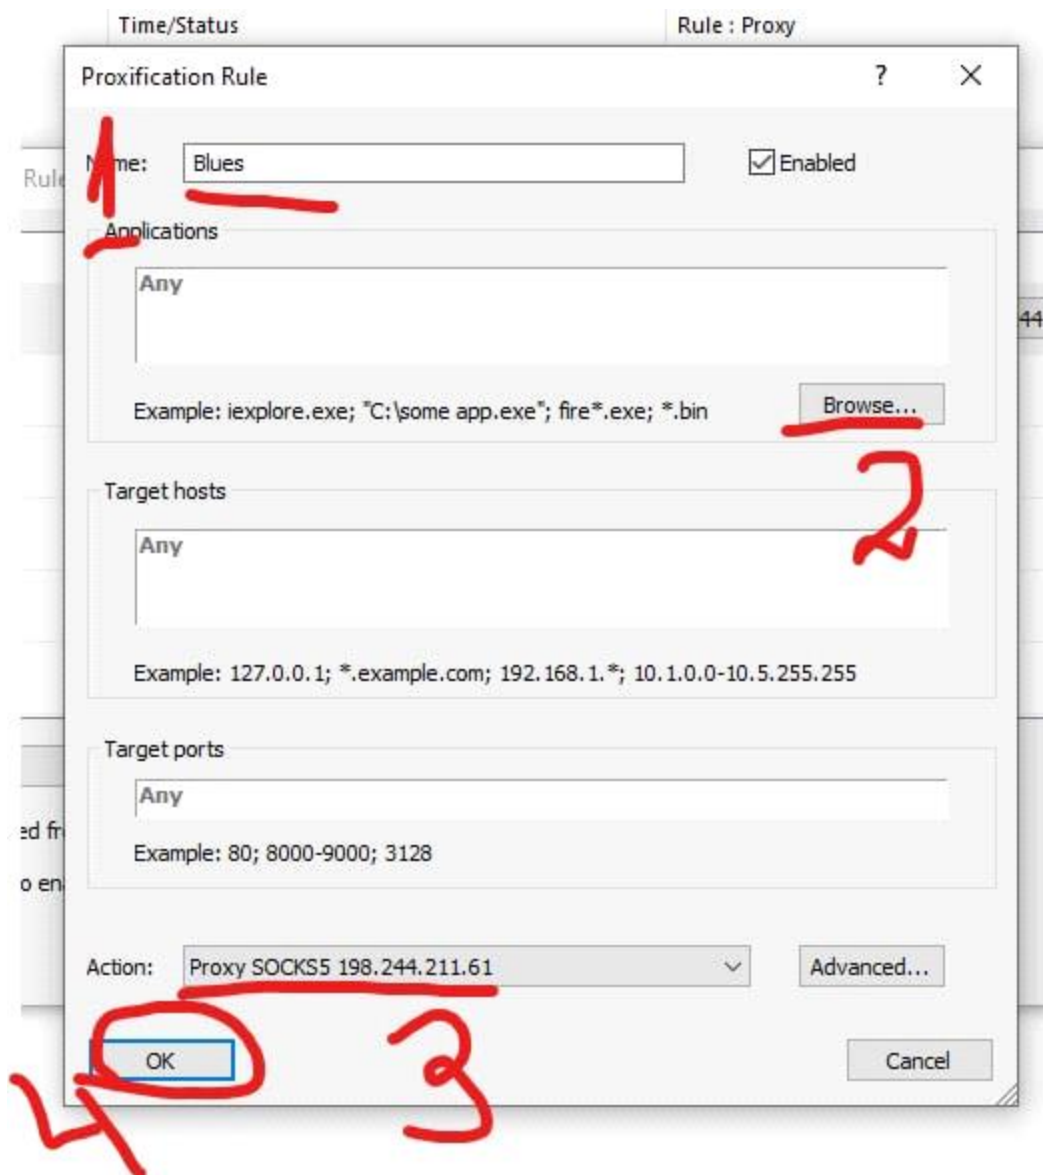

in the window that appears

1 enter the name of the rule Example Bluest

MANDATORY Tick ENABLED

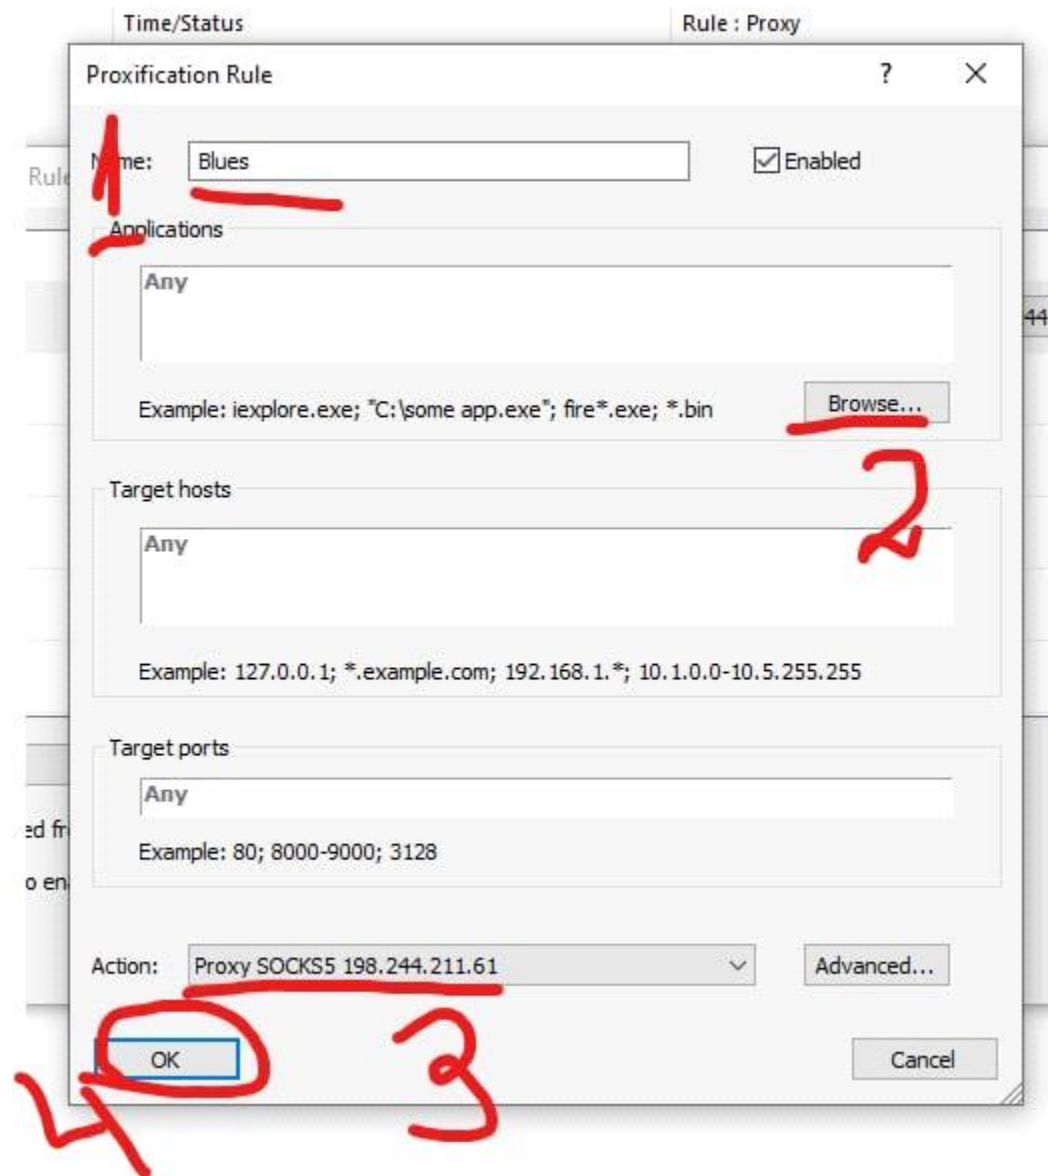

2 in the Applications section, select the path to the file of our emulator.

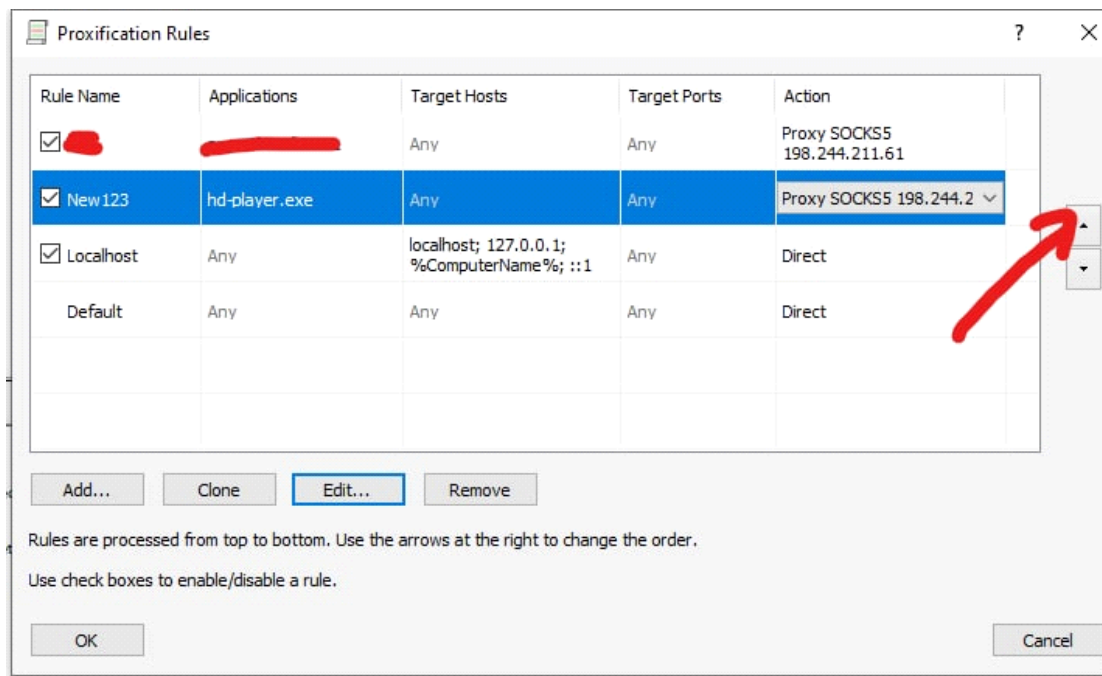

C:\Program Files\BlueStacks_nxt (next screen) HD-Player File

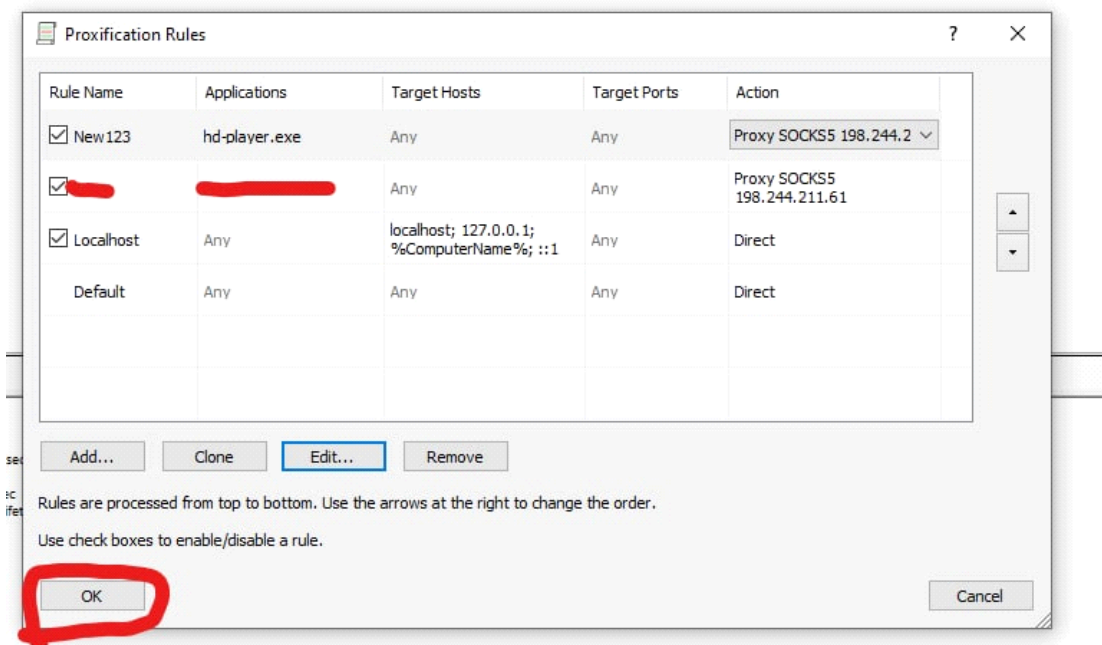

click open this file

3) In the Action section, select the previously created proxy. which will be used for our emulator. Click ok

select the line that appears with our emulator and move it up, as in the screenshot

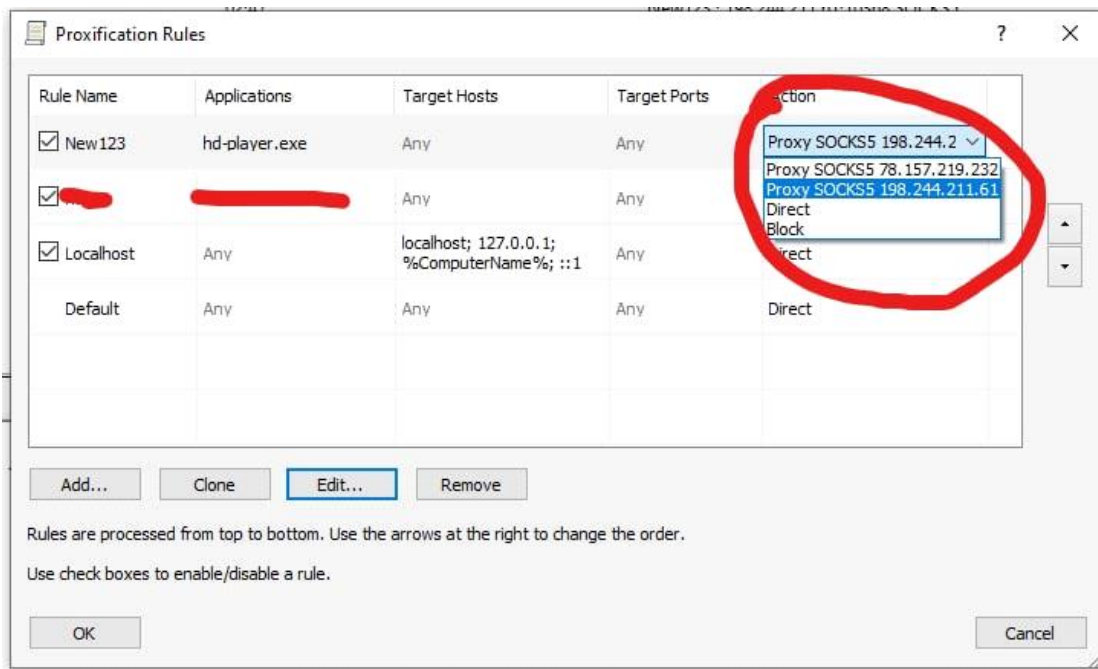

it should turn out like this (it is important to select our proxy in the ACTION column)

for other applications from the list, set DIRECT!!!! press ok

Almost done, we turn off the application. , open the bluestack window manager, and open the standard application for checking the proxy operation

in the running emulator, go to the browser and enter the IP check Whoer.net

check that the proxy is working and enjoy the work

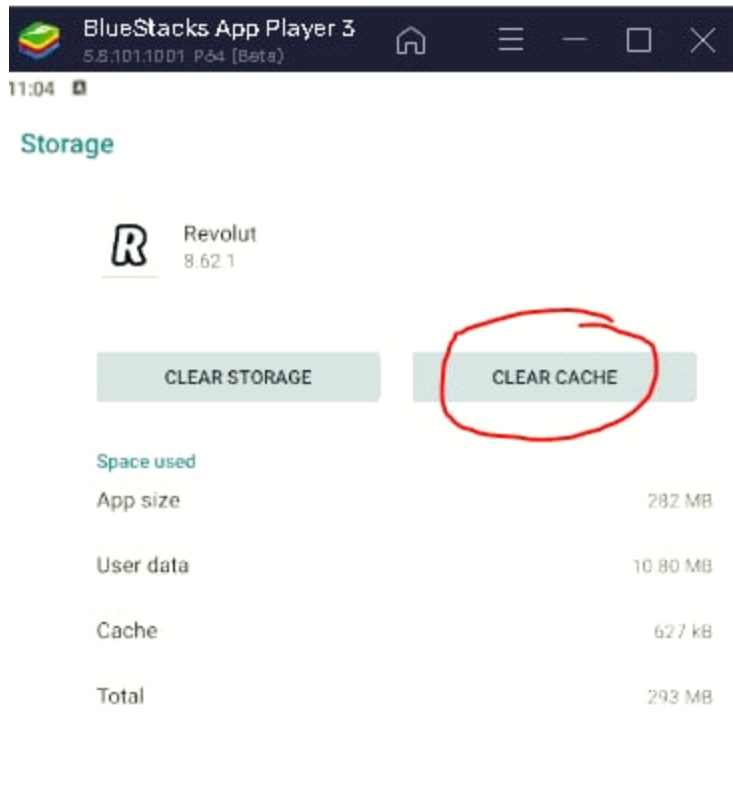

important, for each new emulator, you only need to add a proxy . then in the rules change to the required!!

IMPORTANT ADDITION

If you open a revoluit and immediately crashes.

Go to settings (gear) - Apps - Revoluit - Storage click -> Clear Cache

Since September 2022, accounts come with the VHDX extension. Latest version of Bluestaks 5

Update to the latest version of Bluestaks.

We used to have VHD images. Now we have VHDX. If your file is not replaced. So you are now creating VHD images, you need to change the extension from VHDX to VHD in the archive.

MANDATORY CONDITION FOR SAFETY

We put a VPN on the computer, use it through the VPN, or better, I recommend covering the whole thing with Proxifier.
